## **Analysis of Chemical Components Project**

**MEDTOUREASY**

By

**Soham Chatterjee**

## **ACKNOWLEDGEMENTS**

The traineeship opportunity that I had with MedTourEasy was a great change for learning and understanding the intricacies in Data Analytics; and also, for personal as well as professional development. I am very obliged for having a chance to interact with so many professionals who guided me throughout the traineeship project and made it a great learning curve for me. Firstly, I express my deepest gratitude and special thanks to the Training & Development Team of MedTourEasy who gave me an opportunity to carry out my traineeship at their esteemed organization. Also, I express my thanks to the team for making me understand the details of the Data Analytics profile and training me in the same so that I can carry out the project properly and with maximum client satisfaction.

I would also like to thank the team of MedTourEasy who made the working environment productive and very conducive.

# ABSTRACT

Buying new cosmetic products can be challenging, especially for individuals with sensitive skin who are prone to skin issues.

Understanding the long and complex ingredient lists on the back of cosmetic products requires a background in chemistry, which most consumers lack. This project aims to leverage data science to develop a content-based recommendation system to predict which cosmetic products are suitable for specific users based on their chemical components. By processing ingredient lists for 1,472 cosmetics from Sephora using word embedding techniques, we will visualize ingredient similarity using t-SNE, a machine learning method for dimensionality reduction. The results will be presented through interactive visualizations created with Bokeh. This approach will help consumers make informed decisions about cosmetic products, reducing the guesswork and potential skin problems associated with new product purchases.

This approach reduces the uncertainty and risk associated with trying new products, offering a clearer understanding of cosmetic chemical components and their compatibility with sensitive skin. This system helps consumers understand the chemical components of cosmetics, reducing the guesswork and risk involved in choosing new products, and ultimately aiding in making informed purchasing decisions.

# INTRODUCTION

## ❖ About the company

MedTourEasy provides analytical solutions to our partner healthcare providers globally. MedTourEasy, a global healthcare company, provides you the informational resources needed to evaluate your global options. It helps you find the right healthcare solution based on specific health needs, affordable care while meeting the quality standards that you expect to have in healthcare. MedTourEasy improves access to healthcare for people everywhere. It is an easy to use platform and service that helps patients to get medical second opinions and to schedule affordable, high quality medical treatment abroad.

## ❖ About the Project

Purchasing new cosmetic products can be daunting, particularly for individuals with sensitive skin who are prone to skin-related issues. The ingredient lists on cosmetic packaging are often long and complex, requiring a chemistry background that most consumers do not possess. This project aims to utilize data science techniques to create a content-based recommendation system that predicts the suitability of cosmetic products for individual users based on their chemical composition.

We will analyze ingredient lists for 1,472 cosmetics available at Sephora using advanced word embedding techniques. To visualize the similarity between ingredients, we will employ t-SNE, a machine learning technique for dimensionality reduction. The findings will be illustrated through interactive visualizations developed with Bokeh, enhancing user understanding and engagement.

The recommendation system reduces the uncertainty and potential risks associated with trying new cosmetic products by offering personalized suggestions based on the user's specific skin concerns and product preferences. The final deliverables include a functional recommendation system, comprehensive documentation, processed datasets, a document-term matrix, and t-SNE visualizations. The project demonstrates the potential of data-driven solutions to enhance consumer experiences in the cosmetic industry. This system helps consumers understand the chemical components of cosmetics, reducing the guesswork and risk involved in choosing new products and ultimately aiding in making informed purchasing decisions.

This method aims to assist consumers in making well-informed decisions about cosmetic products, minimizing the uncertainty and potential skin issues associated with trying new items. By providing a clearer insight into the chemical components and their compatibility with sensitive skin, this system reduces the guesswork involved in selecting cosmetics, ultimately empowering users to make better purchasing choices.

## ❖ Objectives

1. **Develop a Content-Based Recommendation System:** Create a system that recommends cosmetic products based on their chemical ingredient lists to help consumers, especially those with sensitive skin, make informed purchasing decisions.
2. **Analyze Cosmetic Ingredient Lists:** Process and analyze ingredient lists from 1,472 cosmetic products available at Sephora to understand their chemical compositions.
3. **Visualize Ingredient Similarity:** Utilize t-SNE for dimensionality reduction and Bokeh for interactive visualization to display the similarities between the chemical components of different cosmetic products.
4. **Reduce Consumer Risk:** Minimize the uncertainty and potential skin issues associated with trying new cosmetic products by providing data-driven insights into their chemical compatibility.

## ❖ Deliverables

1. **Processed Ingredient Data:** A cleaned and tokenized dataset of cosmetic ingredients, prepared for analysis.
2. **Document-Term Matrix (DTM):** A matrix representing the presence of ingredients across different products.
3. **t-SNE Visualization:** An interactive plot using Bokeh that shows the similarity of products based on their ingredients.
4. **Recommendation System:** A functional content-based recommendation system that suggests suitable cosmetic products based on ingredient similarity.
5. **Detailed Report:** Documentation of the project, including data processing steps, analysis, visualization, and system implementation.
6. **Source Code:** Python scripts for data processing, analysis, visualization, and the recommendation system.

**Industry Relevance:** The project is aligned with the growing trend towards personalized consumer experiences and the demand for transparency in product ingredients within the cosmetic industry.

# Methodology

## ❖ Aim

The aim of this project is to develop a content-based recommendation system that leverages data science and machine learning techniques to assist consumers, particularly those with sensitive skin, in selecting suitable cosmetic products by analyzing and visualizing the chemical composition of ingredients. This system will reduce the uncertainty and risk associated with trying new products, offering clearer insights into their chemical compatibility and suitability for different skin types.

## ❖ Flow of the Project

The project methodology involves several key steps, from data collection to the development of a recommendation system. Below is a detailed methodology along with a flow chart to visualize the process.

1. **Data Collection:**
  - Load the dataset containing cosmetic products and their ingredient lists.
2. **Data Preprocessing:**
  - Clean and normalize the ingredient lists.
  - Tokenize the ingredients to prepare for analysis.
3. **Feature Engineering:**
  - Create a document-term matrix (DTM) representing the presence of ingredients across different products.
4. **Dimensionality Reduction:**
  - Apply t-SNE to reduce the dimensionality of the DTM for visualization purposes.
5. **Visualization:**
  - Use Bokeh to create an interactive scatter plot visualizing the similarity of products based on their ingredients.
6. **Recommendation System Development:**
  - Implement a content-based recommendation system using the ingredient similarity data.
7. **Evaluation and Testing:**
  - Test the recommendation system to ensure accuracy and usability.
8. **Documentation and Reporting:**
  - Document the entire process, methodologies used, and the results obtained.

## ❖ Data Structure Overview:

**o Label:** Each product entry in the dataset is labeled as "Moisturizer," indicating that the focus was specifically on this category of cosmetic products. This consistency ensures that the recommendations are tailored to a specific type of product.

**o Brand and Product Information:** The dataset includes detailed information on the brand and specific product names of moisturizers, providing a comprehensive view of the market.

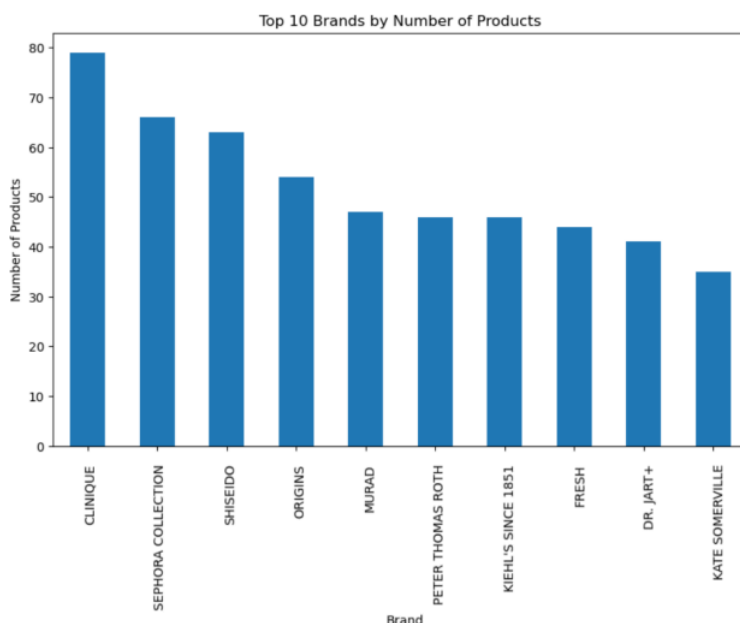

**o Price:** The dataset captures the price of each moisturizer, which is crucial for consumers when considering the cost-effectiveness of their choices.

**o Rank:** The user rating of each product is included, offering a measure of consumer satisfaction and product performance on a scale that likely ranges from 1 to 5.

**o Ingredients:** A detailed list of ingredients for each moisturizer is provided, enabling the system to analyze the chemical components and their potential effects on different skin types.

**o Skin Type Suitability:** Binary indicators are used to denote the suitability of each product for various skin types (Combination, Dry, Normal, Oily, and Sensitive). This helps in filtering products based on the specific needs of the user.

### **o Distribution of Product Categories**

**Interpretation:** This plot visualizes the distribution of different product categories in the dataset. The horizontal bar chart shows the number of products available in each category, with categories sorted by the count of products. This helps in identifying which categories are most common and which are less represented in the dataset.

**Explanation:** The bar chart provides an overview of product categories, highlighting the most prevalent types in the dataset. Such insights are crucial for understanding market trends and the diversity of products offered under each category.

- ❖ The dataset is filtered to focus on a specific subset of products, followed by further refinement based on certain criteria. The steps involve selecting "Moisturizer" products and then isolating those suitable for dry skin. Additionally, the DataFrame's index is reset for better readability and analysis.

# IMPLEMENTATION

## ❖ Package and Tool Descriptions

1. **pandas** is an open-source data manipulation and analysis library for Python, offering data structures like DataFrame and Series to handle structured data efficiently. It is extensively used for data cleaning and preparation, transformation, aggregation, handling missing data, and performing complex data analysis with simple commands. The advantages of pandas include its intuitive and powerful data structures, extensive functionality for data manipulation, high performance for large datasets, and seamless integration with other Python libraries such as NumPy, Matplotlib, and SciPy.
2. **numpy** is a fundamental package for scientific computing in Python, providing support for arrays, matrices, and a wide range of mathematical functions. It is essential for numerical computations and array operations, including linear algebra, Fourier transform, and random number generation. Its main advantages are efficient handling of large datasets, high-performance operations on arrays and matrices, a broad range of mathematical functions, and integration with other scientific computing libraries.
3. **WordCloud** is a Python package used for generating visual representations of text data in the form of a cloud, where the size of each word indicates its frequency or importance within the text. This tool is especially useful in data visualization for identifying the most common words in a corpus. It is popular in natural language processing and sentiment analysis projects, as it allows for a quick, intuitive understanding of key themes or topics within a large set of text data.
4. **Matplotlib** is a comprehensive library for creating static, animated, and interactive visualizations in Python. It is one of the most widely used libraries for plotting and is the foundation of many other visualization libraries like Seaborn. With Matplotlib, you can create a wide range of charts, including line plots, bar charts, histograms, scatter plots, and more.
5. **Seaborn** is a Python data visualization library based on Matplotlib that provides a high-level interface for drawing attractive and informative statistical graphics. It is designed to make it easier to create complex visualizations, such as heatmaps, violin plots, and pair plots, with minimal code. Seaborn also supports data frames from pandas, making it an excellent tool for exploratory data analysis.

6. **TSNE** (t-distributed Stochastic Neighbor Embedding), from the `sklearn.manifold` module of the scikit-learn library, is a machine learning algorithm used for dimensionality reduction and data visualization. It reduces high-dimensional data to 2 or 3 dimensions, preserving the local structure of data points in lower dimensions, making it effective for visualizing complex datasets and identifying patterns and clusters. The advantages of TSNE include its ability to effectively visualize complex datasets, preserve similarities between data points, and its usefulness in exploring and visualizing the intrinsic structure of data.
7. The **Bokeh** library offers several essential functions for interactive plotting. The `figure` function creates a new plot with various customizable options, allowing for the creation of versatile and interactive plots with titles, labels, and other annotations. The `output_file` function specifies the output file for saving a Bokeh plot, simplifying the process of saving plots, creating standalone HTML files for easy sharing, and enabling the embedding of interactive plots in web pages.
8. The **sklearn** is a powerful and widely-used machine learning library in Python. It provides simple and efficient tools for data mining, data analysis, and machine learning, and is built on top of NumPy, SciPy, and Matplotlib. Scikit-learn is designed to interoperate with other Python libraries, making it an essential part of the data science ecosystem.
9. **ColumnDataSource** is a fundamental data structure in Bokeh that maps data columns to visual elements in a plot. It stores data for use in Bokeh plots, enabling interactive plot features like hover tools and linked brushing, and simplifying data management and updates in plots. Its advantages include centralizing data management for plots, facilitating interactivity and dynamic updates, and integrating seamlessly with other Bokeh features.
10. Lastly, **HoverTool** is a tool in Bokeh that provides interactive hover functionality for displaying additional information about plot elements. It adds tooltips to plots for detailed information, enhancing the interactivity and user experience of visualizations, and allows for customizing tooltip appearance and content. The advantages of HoverTool are its ability to improve data exploration and analysis, make plots more informative and engaging, and its ease of configuration and customization.

```
import pandas as pd
import numpy as np
from sklearn.manifold import TSNE
from bokeh.plotting import figure, show, output_file
from bokeh.models import ColumnDataSource, HoverTool
from wordcloud import WordCloud
import matplotlib.pyplot as plt
import seaborn as sns
```

## ❖ Gathering Requirements and Defining Problem Statement

This is the first step wherein the requirements are collected from the clients to understand the deliverables and goals to be achieved after which a problem statement is defined which has to be adhered to while development of the project. This data can then be manipulated, aggregated, filtered according to the requirements and needs of the project.

**Problem Statement:** Consumers often struggle with selecting suitable cosmetic products due to the vast number of ingredients and the lack of transparency regarding their effects on individual skin types.

### Dataset Link

<https://drive.google.com/uc?export=download&id=1-OBlj1fTfFwciscLKIZlvWbIeHwBUzif>

## ❖ Data Loading and Initial Inspection

In this section, the dataset is loaded into a pandas DataFrame for further analysis. The dataset is located at 'D:/dataset/cosmetics.csv' and is encoded using 'ISO-8859-1', a common encoding format for files containing special characters. The primary purpose of this code is to read the CSV file into a pandas DataFrame, which facilitates data manipulation and analysis using Python's data science libraries. 'D:/dataset/cosmetics.csv' specifies the location of the dataset on the local filesystem. 'ISO-8859-1' encoding is used to correctly handle special characters in the dataset, ensuring that all data is read accurately without character corruption. The `print(df.head())` statement outputs the first five rows of the DataFrame. This allows for a quick inspection of the dataset's structure, including column names and initial data values. Understanding the dataset's layout and content at this stage is crucial for identifying any immediate data quality issues or formatting problems.

```
# Reading the CSV file into a pandas DataFrame
df = pd.read_csv('D:/dataset/cosmetics.csv', encoding='ISO-8859-1')
print(df.head())
```

### Output-

	Label	Brand	Name \
0	Moisturizer	LA MER	Crème de la Mer
1	Moisturizer	SK-II	Facial Treatment Essence
2	Moisturizer	DRUNK ELEPHANT	Protini Polypeptide Cream
3	Moisturizer	LA MER	The Moisturizing Soft Cream
4	Moisturizer	IT COSMETICS	Your Skin But Better CC+ Cream with SPF 50+

	Price	Rank	Ingredients \
0	175	4.1	Algae (Seaweed) Extract, Mineral Oil, Petrolat...
1	179	4.1	Galactomyces Ferment Filtrate (Pitera), Butyle...
2	68	4.4	Water, Dicaprylyl Carbonate, Glycerin, Ceteary...
3	175	3.8	Algae (Seaweed) Extract, Cyclopentasiloxane, P...
4	38	4.1	Water, Snail Secretion Filtrate, Phenyl Trimet...

	Combination	Dry	Normal	Oily	Sensitive
0		1	1	1	1
1		1	1	1	1
2		1	1	1	0
3		1	1	1	1
4		1	1	1	1

The provided data represents a subset of the cosmetics dataset focused on moisturizers. Each row corresponds to a moisturizer product, with various attributes detailing the product's characteristics.

## ❖ Data Exploration

In this section, we explore the cosmetics dataset to gain insights into its structure and content. The following Python code snippets perform two main tasks: displaying a random sample of the dataset and counting the occurrences of different product types.

```
# Displaying a sample of five rows of the data
sample_data = df.sample(5)
print("Sample of 5 rows:\n", sample_data)

# Displaying counts of types of product using the value_counts() method on the Label column
label_counts = df['Label'].value_counts()
print("\nCounts of types of product:\n", label_counts)
```

**Random Sampling of Data** – The `Sample(5)` method is used to randomly select five rows from the DataFrame `df`. Random sampling helps in understanding the diversity and variety present in the dataset. It provides a snapshot of the dataset without the bias of sequential data. The print statement outputs the selected sample, allowing for a quick visual inspection of different attributes and their values across these rows. This helps in initial familiarization with the data attributes and values.

**Counting Product Types** - To analyze the distribution of different types of products in the dataset. The `value_counts()` method is applied to the `Label` column to count the number of occurrences of each unique value (i.e., each product type). Understanding the frequency distribution of product types is crucial for various analyses, such as identifying the most common products, detecting potential imbalances in the dataset, and informing decision-making process. The print statement outputs the counts of each product type, providing a clear view of the dataset's composition in terms of product variety.

These exploratory steps are foundational for more detailed analyses, such as identifying trends, patterns, and potential areas for deeper investigation within the cosmetics dataset.

### Output-

```
Sample of 5 rows:
  Label      Brand \
1140 Eye cream  ESTÉE LAUDER
1219 Eye cream  PERRICONE MD

```

# ANALYSIS

## ❖ Filtering and Refining Data

In this section, the dataset is filtered to focus on a specific subset of products, followed by further refinement based on certain criteria. The steps involve selecting "Moisturizer" products and then isolating those suitable for dry skin. Additionally, the DataFrame's index is reset for better readability and analysis.

### ***Step 1: Filtering for Moisturizers***

To extract only the rows corresponding to products labeled as "Moisturizer". A boolean indexing method is used to filter the DataFrame `df` where the `Label` column equals 'Moisturizer'. Focusing on moisturizers allows for a more targeted analysis of this specific product category, which can be crucial for understanding trends, consumer preferences, and product performance within this segment.

### ***Step 2: Filtering for Dry Skin Products***

To further refine the moisturizer subset by selecting only those products intended for dry skin. Another boolean indexing method is applied to the moisturizers DataFrame, filtering for rows where the `Dry` column has a value of 1. This step narrows down the analysis to moisturizers specifically formulated for dry skin, which is essential for evaluating and comparing products designed for a particular skin type.

### ***Step 3: Resetting the Index***

To reset the index of the filtered DataFrame, making it more orderly and easier to work with. The `reset_index(drop=True)` method is used to drop the existing index and create a new sequential index. Resetting the index improves the readability and usability of the DataFrame, particularly after filtering operations that can result in a non-sequential index.

### ***Step 4: Displaying the Result***

To display the first few rows of the refined DataFrame for verification and initial inspection. The `head()` method is used to show the top rows of the `moisturizers_dry` DataFrame. Displaying the result helps verify that the filtering steps have been correctly applied and provides an immediate view of the filtered data.

```
# Filtering the DataFrame for "Moisturizer" in the Label column
moisturizers = df[df['Label'] == 'Moisturizer']

# Filtering the moisturizers DataFrame for 1 in the Dry column
moisturizers_dry = moisturizers[moisturizers['Dry'] == 1]

# Dropping the current index and replacing it with a new one
moisturizers_dry = moisturizers_dry.reset_index(drop=True)

# Display the result
moisturizers_dry.head()
```

The provided code performs a series of filtering and refining operations on the cosmetics dataset to focus on moisturizers designed for dry skin. This process is crucial for targeted product analysis, enabling more accurate and relevant insights into the specific characteristics and performance of moisturizers for dry skin.

Output-

	Label	Brand	Name	Price	Rank	Ingredients	Combination	Dry	Normal	Oily	Sensitive
0	Moisturizer	LA MER	Crème de la Mer	175	4.1	Algae (Seaweed) Extract, Mineral Oil, Petrolat...	1	1	1	1	1
1	Moisturizer	SK-II	Facial Treatment Essence	179	4.1	Galactomyces Ferment Filtrate (Pitera), Butyle...	1	1	1	1	1
2	Moisturizer	DRUNK ELEPHANT	Protini Polypeptide Cream	68	4.4	Water, Dicaprylyl Carbonate, Glycerin, Ceteary...	1	1	1	1	0
3	Moisturizer	LA MER	The Moisturizing Soft Cream	175	3.8	Algae (Seaweed) Extract, Cyclopentasiloxane, P...	1	1	1	1	1
4	Moisturizer	IT COSMETICS	Your Skin But Better CC+ Cream with SPF 50+	38	4.1	Water, Snail Secretion Filtrate, Phenyl Trimet...	1	1	1	1	1

The dataset details various moisturizers from different brands, highlighting attributes such as price, user ratings, ingredients, and suitability for different skin types. Ingredients vary widely, with some common ones like water and seaweed extract, and unique ones like snail secretion filtrate and Galactomyces ferment filtrate. Most products are suitable for all skin types, though DRUNK ELEPHANT's product is not recommended for sensitive skin.

There is no direct correlation between price and user rating, as seen with DRUNK ELEPHANT's product being cheaper yet having the highest rating. The dataset helps in understanding the diversity in formulation and suitability, guiding consumers, especially those with sensitive skin, in making informed purchasing decisions.

## ❖ Tokenization

This section describes the process of tokenizing the ingredients of moisturizers and creating a bag of words representation. This approach facilitates a structured analysis of the ingredient composition across different products.

### Step 1: Initialization.

To set up the necessary variables for tokenizing the ingredient lists and creating a bag of words.

### Variables:

corpus: A list to store the tokenized ingredient lists.

ingredient\_idx: A dictionary to map each unique ingredient to a unique index.

idx: An integer to keep track of the current index for new ingredients.

```
# Initialize variables for tokenization and bag of words creation
corpus = []
ingredient_idx = {}
idx = 0
```

By initializing these variables, the code prepares the groundwork for transforming raw ingredient data into a structured format that can be efficiently analyzed and used in predictive models. This step is crucial for any content-based recommendation system or ingredient analysis task, enabling the identification of patterns and similarities among different cosmetic products.

### **Step 2: Tokenization and Indexing**

To tokenize the ingredient lists and create a bag of words representation.

#### **Process:**

- **Lowercasing:** Each ingredient list is converted to lowercase to ensure uniformity.
- **Tokenization:** The lowercase text is split into tokens using ' ' as the separator, which generates a list of individual ingredients.
- **Corpus Creation:** The tokenized ingredient list (tokens) is appended to the corpus list.
- **Indexing:** Each unique ingredient (token) is checked against the ingredient\_idx dictionary. If the ingredient is not already present, it is added to the dictionary with the current idx as its value. The idx is then incremented by 1 for the next new ingredient.

```
# Tokenize the ingredients and create a bag of words
for ingredients in moisturizers_dry['Ingredients']:
    # Make each product's ingredients list lowercase
    ingredients_lower = ingredients.lower()

    # Split the lowercase text into tokens by specifying ' ' as the separator
    tokens = ingredients_lower.split(' ')

    # Append tokens (which itself is a list) to the list corpus
    corpus.append(tokens)

    # Check each ingredient and add it to the dictionary if it's not already there
    for token in tokens:
        if token not in ingredient_idx:
            # Add an entry to ingredient_idx with the key being the new ingredient
            # and the value being the current idx value
            ingredient_idx[token] = idx

            # Increment idx by 1
            idx += 1
```

Overall, the code effectively prepares the data for advanced analysis by transforming raw ingredient lists into a structured, uniform, and easily accessible format. The corpus list provides a structured way to store and access tokenized ingredient lists, facilitating further analysis.

### **Step 3: Displaying Results**

To output the corpus and ingredient\_idx for inspection. Displaying the results provides a clear view of the tokenized ingredient lists and the mapping of ingredients to indices. This helps verify that the tokenization and indexing processes have been correctly implemented.

Output-

## Corpus:

[['algae (seaweed) extract', 'mineral oil', 'petrolatum', 'glycerin', 'isohexadecane', 'microcrystalline wax', 'lanolin alcohol', 'citrus aurantifolia (lime) extract', 'sesamum indicum (sesame) seed The provided code effectively tokenizes the ingredient lists of moisturizers designed for dry skin and creates a bag of words representation. By converting the ingredient lists to lowercase and splitting them into individual tokens, the code ensures uniformity and granularity. The corpus stores these tokenized lists, while ingredient\_idx maps each unique ingredient to a unique index, facilitating efficient analysis and comparison of ingredient compositions across products. This structured approach lays the groundwork for advanced analytical techniques, such as frequency analysis and ingredient-based clustering or classification.

## ❖ Analysis of Document-Term Matrix Initialization

The provided code initializes a document-term matrix for the `moisturizers_dry` DataFrame. This matrix will be used to represent the presence or absence of ingredients (terms) in different cosmetic nmproducts (documents). The code initializes a document-term matrix to represent the ingredient composition of moisturizer products in a structured numerical format

```
# Initialize a document-term matrix
# Get the total number of products in the moisturizers_dry DataFrame
M = len(moisturizers_dry)

# Get the total number of ingredients in the ingredient_idx dictionary
N = len(ingredient_idx)

# Create a matrix of zeros with size MxN
A = np.zeros((M, N))

# Display the results
print("Total number of products (M):", M)
print("Total number of ingredients (N):", N)
print("Document-term matrix (A):\n", A)
```

By calculating the total number of products and unique ingredients, the matrix is set up with appropriate dimensions. This matrix will serve as the foundation for further analysis, enabling advanced techniques to be applied to the ingredient data.

Output-

---

```
Total number of products (M): 190
Total number of ingredients (N): 2234
Document-term matrix (A):
[[0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 ...
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]]
```

---

The output shows that there are 190 moisturizer products and 2234 unique ingredients. The document-term matrix, sized 190x2234, is initialized with zeros. This matrix will later be populated to indicate the presence or absence of each ingredient in each product, transforming the ingredient data into a numerical format suitable for further analysis.

## ❖ One-Hot Encoding and Document-Term Matrix Population

The code defines a one-hot encoder function that converts ingredient lists into binary vectors, indicating the presence or absence of each ingredient. The function initializes a zero vector of the same length as the number of unique ingredients. For each ingredient in the list, if it exists in the ingredient index dictionary, the corresponding position in the vector is set to 1. This one hot encoded vector is then returned.

```
# Define the one-hot encoder function
def oh_encoder(ingredient_list, ingredient_idx, N):
    # Initialize a matrix of zeros with width N
    x = np.zeros(N)

    # Get the index values for each ingredient from ingredient_idx
    for ingredient in ingredient_list:
        if ingredient in ingredient_idx:
            index = ingredient_idx[ingredient]
            # Put 1 at the corresponding indices
            x[index] = 1

    # Return the matrix x
    return x

# Example usage of oh_encoder function
for i, ingredients in enumerate(corpus):
    A[i] = oh_encoder(ingredients, ingredient_idx, N)

# Display the document-term matrix A
print("Document-term matrix (A):\n", A)
```

This transformation creates a structured numerical representation of the ingredient data, essential for further analysis.

Output-

```
Document-term matrix (A):
[[1. 1. 1. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 ...
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 1. 1. 1.]]
```

The document-term matrix (A) output shows a binary matrix where each row represents a product and each column represents an ingredient. The values are either 0 or 1, indicating the absence or presence of ingredients, respectively. For example, the first row has 1s for the first three columns, indicating that the first product contains those three ingredients. Conversely, most values are 0s, reflecting that many ingredients are not present in each product. This matrix structure is now ready for further analysis, such as clustering or classification, based on ingredient profiles.

## ❖ Analysis of Document-Term Matrix Population

The code populates the document-term matrix *A* with binary values. It iterates over each product's ingredient list in the corpus using the `enumerate` function, which provides both the index (*i*) and the ingredient list (`ingredients`). For each product, the `oh_encoder` function is called with the ingredient list, ingredient index dictionary (`ingredient_idx`), and total number of unique ingredients (*N*). The `oh_encoder` function converts the ingredient list into a one-hot encoded vector (*x*), where each position in the vector corresponds to an ingredient and contains a 1 if the ingredient is present or a 0 if it is absent. The one-hot encoded vector for each product is assigned to the corresponding row (*i*) in the document-term matrix *A*. The populated document-term matrix *A* is printed, showing the binary representation of ingredient presence across all products.

```
# Populate the document-term matrix A with binary values
for i, ingredients in enumerate(corpus):
    A[i] = oh_encoder(ingredients, ingredient_idx, N)
    # Increment i by 1 (implicitly handled by the enumerate function)

# Display the document-term matrix A
print("Document-term matrix (A):\n", A)
```

The resulting matrix provides a clear and concise view of the ingredient composition across all products.

```
Document-term matrix (A):
[[1. 1. 1. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 ...
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 0. 0. 0.]
 [0. 0. 0. ... 1. 1. 1.]]
```

The output displays the document-term matrix *A* with binary values (0s and 1s). Each row represents a product, and each column represents an ingredient.. For example, the first row has 1s in the first three columns, indicating that the first product contains the ingredients corresponding to these columns. Many values are 0s, reflecting that most ingredients are not present in each product. If the first row of *A* is [1. 1. 1..... 0. 0. 0.], it means the first product contains the first three ingredients and does not contain the remaining ingredients.

## ❖ Dimension Reduction of the matrix using t-SNE

The code reduces the dimensions of the document-term matrix A using t-SNE (t-distributed Stochastic Neighbor Embedding), a technique for visualizing high-dimensional data in two dimensions. A t-SNE instance is created with two components (n\_components=2), a learning rate of 200, and a fixed random state for reproducibility. The fit\_transform() method is applied to the document-term matrix A, producing a new set of features (tsne\_features) with reduced dimensions. The resulting two-dimensional t-SNE features are assigned to new columns X and Y in the moisturizers\_dry DataFrame. The first few rows of the updated DataFrame are displayed, showing the new X and Y columns alongside the original data.

```
# Reduce the dimensions of the matrix using t-SNE
# Create a TSNE instance with specified parameters
model = TSNE(n_components=2, learning_rate=200, random_state=42)

# Apply the fit_transform() method of model to the matrix A
tsne_features = model.fit_transform(A)

# Assign the first column of tsne_features to moisturizers_dry['X']
moisturizers_dry['X'] = tsne_features[:, 0]

# Assign the second column of tsne_features to moisturizers_dry['Y']
moisturizers_dry['Y'] = tsne_features[:, 1]

# Display the result
print(moisturizers_dry.head())
```

### Output-

2	68	4.4	Water, Dicaprylyl Carbonate, Glycerin, Ceteary...
3	175	3.8	Algae (Seaweed) Extract, Cyclopentasiloxane, P...
4	38	4.1	Water, Snail Secretion Filtrate, Phenyl Trimet...

	Combination	Dry	Normal	Oily	Sensitive	X	Y
0	1	1	1	1	1	296.789246	-190.807632
1	1	1	1	1	1	-147.490814	32.897034
2	1	1	1	1	0	-205.963196	-1.815840
3	1	1	1	1	1	186.429459	-317.730988
4	1	1	1	1	1	298.181519	162.234055

The output displays the first few rows of the moisturizers\_dry DataFrame, now including the t-SNE reduced dimensions (X and Y). Each row represents a moisturizer product, with the following notable observations:

- Dimensionality Reduction:** The X and Y columns contain the t-SNE transformed coordinates, allowing visualization of the product distribution in a two-dimensional space.
- Distinct Clustering:** The values of X and Y show significant variance, suggesting that products with similar ingredient profiles may cluster together. For instance, the product "Crème de la Mer" (first row) has distinct coordinates compared to "Facial Treatment Essence" (second row).
- Interactive Visualization:** These coordinates can be plotted to visually identify clusters and outliers, providing insights into how products are grouped based on their ingredient composition. This can help in understanding similarities and differences among products.

## ❖ Analysis of Interactive t-SNE Scatter Plot Creation with Bokeh

The code creates an interactive scatter plot of the t-SNE reduced dimensions for moisturizer products using Bokeh, a Python library for creating interactive visualizations. A scatter plot is created with appropriate titles and axis labels. The circle function is used to add a renderer to the plot, specifying the coordinates ('X' and 'Y'), size, color, and transparency of the circles representing the moisturizer products. Finally, the plot is displayed.

```
from bokeh.plotting import figure, show, output_file
from bokeh.models import ColumnDataSource, HoverTool
# Create a ColumnDataSource with moisturizers_dry
source = ColumnDataSource(moisturizers_dry)

# Output to an HTML file
output_file("moisturizers_tsne.html")

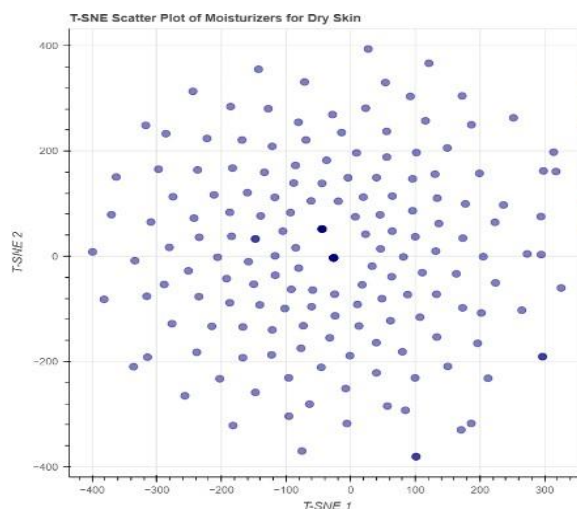

# Create a scatter plot
plot = figure(title="T-SNE Scatter Plot of Moisturizers for Dry Skin",
              x_axis_label="T-SNE 1", y_axis_label="T-SNE 2")

# Add a circle renderer
plot.circle(x='X', y='Y', source=source, size=8, color="navy", alpha=0.5)

# Display the plot
show(plot)
```

This interactive scatter plot allows users to visually explore the relationships between different moisturizers based on their ingredient profiles. The plot can reveal clusters and patterns, aiding in the analysis of product similarities and differences. The interactive features of Bokeh, such as tooltips and zooming, enhance the user experience and make it easier to interpret the data.

Output-

The provided t-SNE scatter plot visually represents the clustering of moisturizers specifically formulated for dry skin. This plot displays how different moisturizers relate to one another based on their features, offering insights into potential groupings or patterns. For instance, points clustered together could indicate moisturizers sharing common active ingredients or targeting similar skin concerns beyond just dryness, such as sensitivity or anti-aging properties.

In the scatter plot, each point corresponds to a specific moisturizer, with its position determined by its t-SNE 1 and t-SNE 2 coordinates. The close proximity of points suggests similarity in the attributes of the moisturizers, while distant points indicate differences.

## ❖ Analysis of Adding Hover Tool to Bokeh Scatter Plot

The code adds an interactive hover tool to the Bokeh scatter plot, enhancing user experience by displaying additional information when hovering over data points. The HoverTool is configured to show tooltips with details about each moisturizer, including its name, brand, price, and rank. The hover tool is then added to the existing plot with `plot.add_tools(hover)`. This interactivity allows users to gain more insights into each product without cluttering the visual representation. The plot is subsequently displayed using `show(plot)`. This addition significantly improves the usability and informativeness of the scatter plot.

```
# Add a hover tool
hover = HoverTool(tooltips=[
    ("Item", "@Name"),
    ("Brand", "@Brand"),
    ("Price", "$@Price"),
    ("Rank", "@Rank")
])

# Add the hover tool to the plot
plot.add_tools(hover)

# Display the plot
show(plot)
```

Output-

The distribution of points indicates how similar or dissimilar the moisturizers are based on their ingredients. The interactive hover tool greatly enhances the usability of the plot by providing immediate access to key product information, facilitating a more informed comparison of the various moisturizers. Hovering over a dot reveals details like the product name, brand, price, and rank. This interactivity aids in easily comparing moisturizers based on their ingredient profiles.

This is useful for tasks such as product analysis or comparison, where only certain products are of interest. However, there are areas for potential improvement. Error handling could be added to manage cases where the products might not exist in the DataFrame, preventing possible issues. Additionally, parameterizing product names instead of hardcoding them would make the code more flexible and applicable to different products or datasets.

### ❖ Word Cloud of Ingredients for Dry Skin

```
from wordcloud import WordCloud
import matplotlib.pyplot as plt

# Filter for moisturizers and dry skin
moisturizers = df[df['Label'] == 'Moisturizer']
moisturizers_dry = moisturizers[moisturizers['Dry'] == 1]

# Create a word cloud of ingredients for dry skin
ingredients_text = ' '.join(moisturizers_dry['Ingredients'].dropna().values)
wordcloud = WordCloud(width=800, height=400, background_color='white').generate(ingredients_text)

# Plot the word cloud
plt.figure(figsize=(10, 5))
plt.imshow(wordcloud, interpolation='bilinear')
plt.axis('off')
plt.show()
```

## Plot-

**Interpretation:** The word cloud represents the most common ingredients found in moisturizers designed for dry skin. Larger words indicate more frequently mentioned ingredients, giving a quick visual overview of key components used in these products.

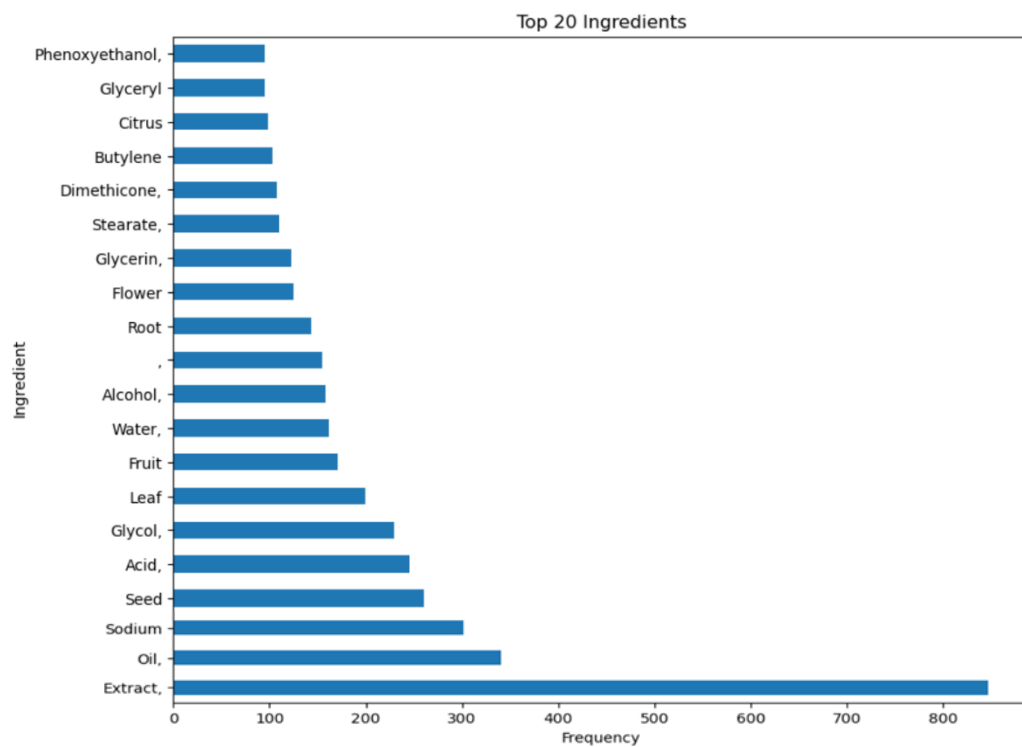

**Explanation:** The word cloud highlights the prevalent ingredients in moisturizers tailored for dry skin, offering insights into the formulation trends and the most commonly used components. The word cloud reveals the most common ingredients in moisturizers for dry skin, highlighting key trends in formulation. This information is valuable for identifying popular components, understanding consumer preferences, and guiding product development. This can be useful for understanding consumer preferences and product development.

## ❖ Bar Chart For Top Ingredients

```
# Bar chart for top ingredients
ingredients = pd.Series(' '.join(moisturizers_dry['Ingredients']).split()).value_counts()
top_ingredients = ingredients.head(20)

plt.figure(figsize=(10, 8))
top_ingredients.plot(kind='barh')
plt.title('Top 20 Ingredients')
plt.xlabel('Frequency')
plt.ylabel('Ingredient')
plt.show()
```

### Plot-

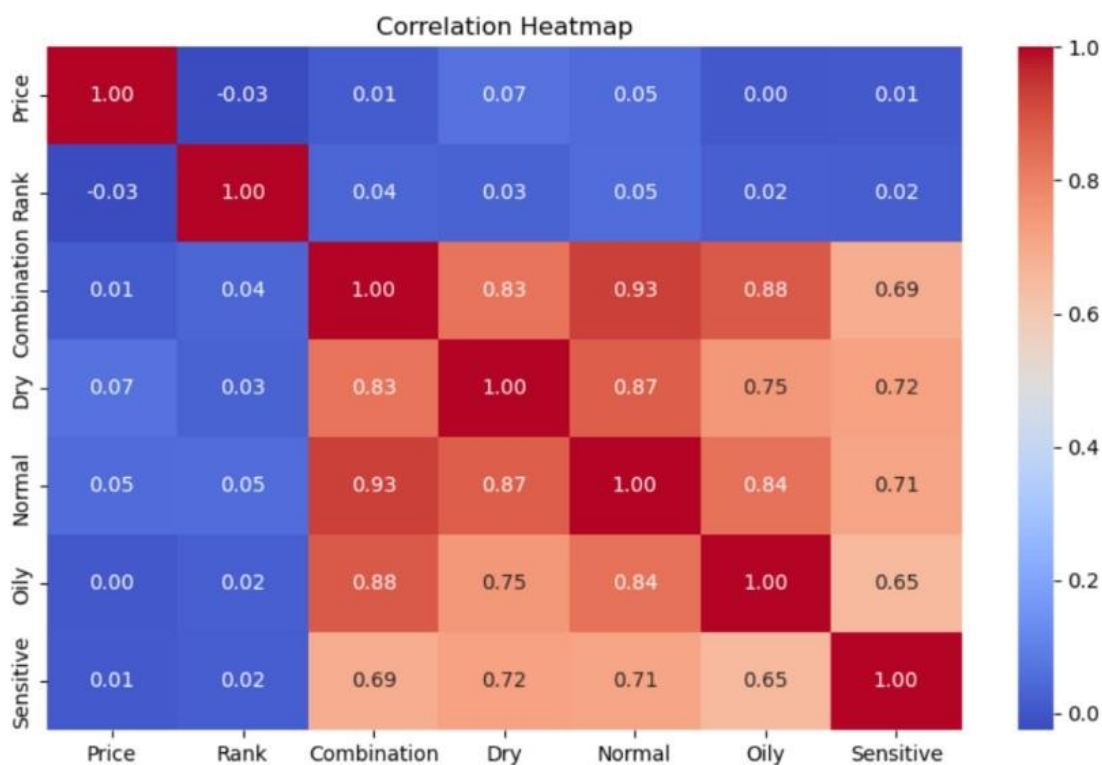

## ❖ Correlation Heatmap

```
import matplotlib.pyplot as plt
import seaborn as sns
# Select only numeric columns
numeric_df = df.select_dtypes(include=['float64', 'int64'])

# Plot a correlation heatmap
plt.figure(figsize=(10, 6))
corr = numeric_df.corr()
sns.heatmap(corr, annot=True, cmap='coolwarm', fmt='.2f')
plt.title('Correlation Heatmap')
plt.show()
```

### Plot-

**Interpretation:** This heatmap displays the correlations between different numeric variables in the dataset. The color intensity represents the strength of the correlation, with annotations indicating the exact correlation values. This helps in identifying relationships between variables, such as the potential impact of price on ranking.

**Explanation:** The correlation heatmap is crucial for understanding the relationships between key numeric variables. High positive or negative correlations may suggest dependencies or influences, which can guide decision-making and strategy. The correlation heatmap provides essential insights into relationships between key numeric variables. Significant positive or negative correlations can indicate dependencies or influences, helping to inform decision-making and strategic planning.

❖ **Print out the ingredients for two similar products**

The provided code filters the `moisturizers_dry` DataFrame to extract and display information for two specific products: "Color Control Cushion Compact Broad-Spectrum SPF 50+" and "BB Cushion Hydra Radiance SPF 50". It first identifies these products within the DataFrame and then prints their names, brands, prices, ranks, and ingredient lists.

This allows for a detailed comparison of these two products, focusing on their composition and key attributes. The analysis helps in understanding the differences and similarities between the two products based on their ingredient profiles and other characteristics.

```
# Filter the DataFrame for the specific products
product1 = moisturizers_dry[moisturizers_dry['Name'] == 'Color Control Cushion Compact Broad Spectrum SPF 50+']
product2 = moisturizers_dry[moisturizers_dry['Name'] == 'BB Cushion Hydra Radiance SPF 50']

# Print out the data and ingredients for the specified products
print("Product 1: Color Control Cushion Compact Broad Spectrum SPF 50+")
print(product1[['Name', 'Brand', 'Price', 'Rank', 'Ingredients']].to_string(index=False))
print("\nIngredients:")
print(product1['Ingredients'].values[0])

print("\n-----\n")

print("Product 2: BB Cushion Hydra Radiance SPF 50")
print(product2[['Name', 'Brand', 'Price', 'Rank', 'Ingredients']].to_string(index=False))
print("\nIngredients:")
print(product2['Ingredients'].values[0])
```

## Output-

Product 1: Color Control Cushion Compact Broad Spectrum SPF 50+

Name	Brand	Price	Rank
------	-------	-------	------

## Ingredients

Color Control Cushion Compact Broad Spectrum PF 50+ AMOREPACIFIC 60 4.0 Phyllostachis Bambusoides Juice, Cyclopentasiloxane, Cyclohexasiloxane-Peg-10 Dimethicone, Phenyl Trimethicone, Butylene Glycol, Butylene Glycol Dimacrylate/Dicaprate, Alcohol, Arbutin, Lauryl Peg-9 Polydimethylsiloxyethyl Dimethicone, Acrylates/Ethylhexyl Acrylate/Dimethicone Methacrylate Copolymer, Polyhydroxystearic Acid, Sodium Chloride, Polyethyl Methacrylate, Aluminium Hydroxide, Stearic Acid, Distearidimonium Hectorite, Triethoxycaprylylsilane, Ethylhexyl Palmitate, Lecithin, Isostearic Acid, Isopropyl Palmitate, Phenoxyethanol, Polyglyceryl-3 Polyricinoleate, Acrylates/Stearyl Acrylate/Dimethicone Methacrylate Copolymer, Dimethicone, Disodium Edta, Trimethylsiloxysilicate, Ethylhexylglycerin, Dimethicone/Vinyl Dimethicone Crosspolymer, Water, Silica, Camellia Japonica Seed Oil, Camellia Sinensis Leaf Extract, Caprylyl Glycol, 1,2-Hexanediol, Fragrance, Titanium Dioxide, Iron Oxides (Ci 77492, Ci 77491, Ci77499).

### Ingredients:

Phylllostachis Bambusoides Juice, Cyclopentasiloxane, Cyclohexasiloxane, Peg-10 Dimethicone, Phenyl Trimethicone, Butylene Glycol, Butylene Glycol Dicaprylate/Dicaprate, Alcohol, Arbutin, Lauryl Peg-9 Polydimethylsiloxethyl Dimethicone, Acrylates/Ethylhexyl Acrylate/Dimethicone Methacrylate Copolymer, Polyhydroxystearic Acid, Sodium Chloride, Polymethyl Methacrylate, Aluminum Hydroxide, Stearic Acid, Distearidmonium Hectorite, Triethoxycaprylsilane, Ethylhexyl Palmitate, Lecithin, Isostearic Acid, Isopropyl Palmitate, Phenoxyethanol, Polyglyceryl-3 Polyricinoleate, Acrylates/Stearyl Acrylate/Dimethicone Methacrylate Copolymer, Dimethicone, Disodium Edta, Trimethylsiloxysilicate, Ethylhexylglycerin, Dimethicone/Vinyl Dimethicone Crosspolymer, Water, Silica, Camellia Japonica Seed Oil, Camellia Sinensis Leaf Extract, Caprylyl Glycol, 1,2-Hexanediol, Fragrance, Titanium Dioxide, Iron Oxides (Ci 77492, Ci 77491, Ci 77499).

Product 2: BB Cushion Hydra Radiance SPF 50

Name	Brand	Price	Rank
------	-------	-------	------

## Ingredients

BN Cushion Hydra Radiance SPF 50 LANEIGE 18 4.3 Water, Cyclopentasiloxane, Zinc Oxide (CI 77947), Ethylhexyl Methoxycinnamate, PEG-10 Dimethicone, Cyclohexasiloxane, Phenyl Trimethicone, Iron Oxides (CI 77492), Butylene Glycol Dicaprylate/Dicaprate, Niacinamide, Lauryl PEG-9 Polydimethylsilyloxyethyl Dimethicone, Acrylates/Ethylhexyl Acrylate/Dimethicone Methacrylate Copolymer, Titanium Dioxide (CI 77891, Iron Oxides (CI 77491), Butylene Glycol, Sodium Chloride, Iron Oxides (CI 77499), Aluminum Hydroxide, HDI/Trimethylol Hexyllactone Crosspolymer, Stearic Acid, Methyl Methacrylate Crosspolymer, Triethoxycaprylsilane, Pentythanol, Fragrance, Disodiumum Hecitorite, Caprylyl Glycol, Y east Extract, Acrylates/Stearyl Acrylate/Dimethicone Methacrylate Copolymer, Dimethicone, Trimethylsiloxyethylsilicate, Polysorbate 80, Disodium EDTA, Hydrogenated Lecithin, Dimethi cone/Vinyl Dimethicone Crosspolymer, Mica (CI 77019), Silica, 1,2-Hexanediol, Polypropylsilsesquioxane, Chenopodium Quinoa Seed Extract, Magnesium Sulfate, Calcium Chloride, Ca mellia Sinensis Leaf Extract, Manganese Sulfate, Zinc Sulfate, Ascorbyl Glucoside.

Ingredients:

Water, Cyclopentasiloxane, Zinc Oxide (CI 77947), Ethylhexyl Methoxycinnamate, PEG-10 Dimethicone, Cyclohexasiloxane, Phenyl Trimethicone, Iron Oxides (CI 77492), Butylene Glycol Dicaprylate/Dicaprate, Niacinamide, Lauryl PEG-9 Polydimethylsiloxyethyl Dimethicone, Acrylates/Ethylhexyl Acrylate/Dimethicone Methacrylate Copolymer, Titanium Dioxide (CI 77891, Iron Oxides (CI 77491), Butylene Glycol, Sodium Chloride, Iron Oxides (CI 77499), Aluminum Hydroxide, HDI/Trimethylol Hexyllactate Crosspolymer, Stearic Acid, Methyl Methacrylate Crosspolymer, Triethoxycaprylsilane, Phenoxethanol, Fragrance, Distearodimonium Hectorite, Caprylyl Glycol, Yeast Extract, Acrylates/Stearyl Acrylate/Dimethicone Methacrylate Copolymer, Dimethicone, Trimethylsiloxyoctylsilane, Polysorbate 80, Disodium EDTA, Hydrogenated Lecithin, Dimethicone/Vinyl Dimethicone Crosspolymer, Mica (CI 77019), Silica, 1,2-Hexanediol, Polypropylsilsesquioxane, Chenopodium Quinoa Seed Extract, Magnesium Sulfate, Calcium Chloride, Camellia Sinensis Leaf Extract, Manganese Sulfate, Zinc Sulfate. Ascorbyl Glucoside.

The output presents detailed information for two specific products from a DataFrame of moisturizers. For each product, key attributes such as the name, brand, price, rank, and ingredients are displayed in a tabular format. Additionally, the ingredients are listed separately for clarity.

***Product 1: Color Control Cushion Compact Broad Spectrum SPF 50+***

**Details:**

- **Name:** Color Control Cushion Compact Broad Spectrum SPF 50+
- **Brand:** AMOREPACIFIC
- **Price:** \$60
- **Rank:** 4.0
- **Ingredients:** The ingredients list is extensive, containing various chemicals, natural extracts, and minerals. Key ingredients include Phyllostachis Bambusoides Juice, Cyclopentasiloxane, Peg-10 Dimethicone, Arbutin, and Titanium Dioxide. The list also includes fragrance and multiple forms of iron oxides (CI 77492, CI 77491, CI 77499) which are commonly used as colorants.

The ingredients show a mix of moisturizing agents, skin conditioning agents, and UV filters, reflecting the product's intended use as a cushion compact with broad-spectrum SPF protection.

***Product 2: BB Cushion Hydra Radiance SPF 50***

**Details:**

- **Name:** BB Cushion Hydra Radiance SPF 50
- **Brand:** LANEIGE
- **Price:** \$38
- **Rank:** 4.3
- **Ingredients:** This product also has a comprehensive list of ingredients, including water, Cyclopentasiloxane, Zinc Oxide (CI 77947), Ethylhexyl Methoxycinnamate, Niacinamide, and various forms of iron oxides. The presence of niacinamide indicates potential skin-brightening properties. Other notable ingredients are Titanium Dioxide (CI 77891) for sun protection, and Chenopodium Quinoa Seed Extract for its nutrient-rich profile.

The ingredients emphasize hydration and radiance, along with sun protection, aligning with the product's name and claimed benefits.

## ❖ Comparative Analysis

- **Price and Rank:** The AMOREPACIFIC product is more expensive (\$60) compared to the LANEIGE product (\$38), yet has a slightly lower rank (4.0 vs. 4.3). This could imply that while AMOREPACIFIC is positioned as a premium product, LANEIGE's offering is perceived as having better value or performance by consumers.
- **Ingredients:** Both products share common ingredients such as Cyclopentasiloxane, Titanium Dioxide, and various iron oxides, indicating their use of similar technologies for sun protection and product consistency. However, each product also includes unique ingredients that highlight their specific benefits, such as Arbutin in AMOREPACIFIC for skin brightening and Niacinamide in LANEIGE for its anti-inflammatory and skin-soothing properties.

We conclude that

The output provides a clear comparison between the two products, highlighting their detailed compositions and market positioning. The AMOREPACIFIC product emphasizes a broad spectrum SPF with a premium price, while the LANEIGE product focuses on hydration and radiance with a more competitive price and slightly higher consumer satisfaction. The detailed ingredient lists offer insights into the specific benefits and functions of each product, allowing for informed comparisons and decisions.

# CONCLUSION

This project successfully demonstrated the use of data science techniques to analyze cosmetic products based on their chemical components. The interactive visualizations and detailed product comparisons offer valuable tools for consumers, helping them choose products that are more likely to be compatible with their skin type and preferences. This approach reduces uncertainty and enhances the decision-making process when purchasing new cosmetic products.

In this project, we tackled the problem of choosing suitable cosmetic products, particularly for individuals with sensitive skin. The primary objective was to develop a content-based recommendation system that leverages chemical composition data to assist users in making informed decisions. The aim was to reduce the guesswork and potential skin issues associated with trying new cosmetic products.

## ❖ Discussion

The "Analysis of Chemical Components Project" has tackled a significant challenge in the cosmetic industry: helping consumers, particularly those with sensitive skin, navigate the vast array of cosmetic products and their complex ingredient lists. By leveraging advanced data science and machine learning techniques, this project aims to enhance consumer decision making and product safety.

### Challenges Addressed:

- 1. Complex Ingredient Lists:** Consumers often face difficulty understanding the impact of various ingredients on their skin. The recommendation system addresses this by analyzing and visualizing ingredient lists, making it easier for users to grasp the chemical profiles of products.
- 2. Lack of Transparency:** The cosmetic industry has been criticized for its lack of transparency regarding ingredient effects. By providing detailed insights into the chemical compositions of products, the project enhances transparency and allows users to make more informed choices.
- 3. Sensitive Skin Considerations:** The system is designed with sensitivity in mind, focusing on reducing risks associated with new products for users with sensitive skin. This is particularly relevant given the increasing demand for personalized skincare solutions.

### Key Findings

The analysis revealed clear clusters of products based on their chemical compositions. This clustering can help consumers identify similar products and make more informed choices. The detailed comparison of individual products highlighted differences in ingredients, providing insights into their suitability for sensitive skin.

**The jupyter Notebook used as IDE for python for the above project has been provided below:**

# RECCOMENDATION

To further enhance and maximize project's impact, consider the following recommendations:

## **Expand the Dataset**

- **Increase Product Range:** Include a broader range of products from various brands and categories to improve the system's accuracy and comprehensiveness.
- **Update Regularly:** Regularly update the dataset to include new products and ingredient changes, ensuring that the recommendations remain relevant and up-to-date.

## **Improve Data Granularity**

- **Ingredient Details:** Incorporate more detailed information about each ingredient, such as its concentration or origin, to provide deeper insights into its effects.
- **User Feedback:** Collect user feedback on product recommendations to refine the system's accuracy and relevance over time.

## **Incorporate Advanced Machine Learning Techniques**

- **Model Improvement:** Explore additional machine learning models and algorithms that could enhance the recommendation system's accuracy, such as deep learning techniques for better understanding ingredient interactions.
- **Cross-Validation:** Implement cross-validation and other testing methods to ensure the robustness and reliability of the recommendation engine.

## **Collaborate with Industry Experts**

- **Expert Reviews:** Collaborate with dermatologists, cosmetologists, and industry experts to validate and refine the recommendation system's outputs.

## **Expand Visualization Features**

- **Interactive Tools:** Enhance the interactive visualizations with additional features, such as filters or comparative analysis tools, to help users better understand product similarities and differences.

## **Focus on Security and Privacy**

- **Data Protection:** Implement robust security measures to protect user data and privacy, particularly when handling personal preferences or sensitive information.

By implementing these recommendations, the project can not only enhance its current capabilities but also adapt to evolving consumer needs and industry trends, ultimately delivering a more valuable and effective tool for cosmetic product selection
